

HACKWITHHYDERABAD 2026 — FINAL SUBMISSION

Project: Deal Intelligence Agent Skill (DIAS) | **Cognitive Brain:** Vectorize Hindsight Cloud

CRITICAL SUBMISSION CHECKLIST & RULES:

1. **DO NOT** mention 'Hackathon' in LinkedIn Post or Article title/body/tags (Strict Disqualification Rule).
2. All team members must complete the Profile Review Form: <https://forms.gle/AXWnanWsEEir6xSP9>.
3. Submit this finalized project on Google Form: <https://forms.gle/cD7fCnPkdVm2sH78> before deadline.

■ Official Google Form Submission Fields (Copy-Paste Directory)

Open the final submission form at <https://forms.gle/cD7fCnPkdVm2sH78> and fill with these exact details:

Form Field	Exact Value to Submit / Guidance
Email ID *	manibhushanam4k@gmail.com
Phone Number *	[Enter your 10-digit registered mobile number, e.g., +91 9876543210]
Team Name *	[Enter your exact registered Team Name as entered during registration]
Team Members *	[List full legal names of all team members, e.g., Manibhushanam K, ...]
GitHub Repository Link *	https://github.com/Manibhushanamk/DEAL-INTELLIGENCE-AGENT-SKILL-DIAS-
Social Media Post (LinkedIn) *	Paste the public URL of your LinkedIn post (Use Section 3 of this document for exact copy).
Article Link *	Paste your published Dev.to / Medium / Hashnode article URL (Use Section 4 for complete text).
Video Link *	Paste your public YouTube demo video URL (Use Section 2 for complete second-by-second script).
Reddit Post Link *	Paste your published link from <i>r/aiagents</i> or <i>r/aimemory</i> (Use Section 5 for copy).
FEEDBACK *	Copy the comprehensive organizer feedback provided in Section 6 of this dossier.

■ Project Identity & Technical Highlights

- **Project Name:** Deal Intelligence Agent Skill (DIAS)
- **Core Novelty:** Persistent multi-session memory via **Vectorize Hindsight Cloud** + **Adaptive MCP capability evolution**.
- **Verified Architecture:** Two-dimensional memory banks (dias_deals and dias_telemetry) hosted on api.hindsight.vectorize.io.
- **Real Invariant Assertions:** 20/20 pytest tests passing in 44.4s, zero credential leaks (hsk_...50fc), live ReportLab PDF dossier generation (6,224 bytes).

■ 3-Minute Video Demo — Complete Screening & Dialogue Guide

Video Goal: Deliver a crisp, confident, 1080p screen-recorded walkthrough (2 to 3 minutes) demonstrating how DIAS transforms a stateless coding agent into an evolving deal intelligence copilot using Vectorize Hindsight Cloud.

Recording Setup: Open terminal with font size 16+, browser tab on Hindsight Cloud Dashboard (<https://ui.hindsight.vectorize.io/dashboard>), and PDF reader ready to open `acme_corp_deal_dossier.pdf`.

Time	Screen Action (What to Show)	Exact Voiceover Dialogue (What to Say)
00:00 - 00:30 (30s)	Split Screen: 1. Open GitHub repo README. 2. Camera on face (optional) or terminal. 3. Show diagram of traditional stateless agent forgetting everything.	"Hi everyone! I'm Manibhushanam, and this is DIAS — Deal Intelligence Agent Skill . Today, AI coding agents are stateless. Every time you start a session, it's Day 1 all over again: they forget customer requirements, ignore past compliance mandates, and can't adapt their tools. We solved this by giving host coding agents a permanent cognitive brain powered by Vectorize Hindsight Cloud ."
00:30 - 01:00 (30s)	Terminal Action: Run command: <code>python3 -m src.setup_wizard</code> Highlight steps 1 through 6 on screen with mouse cursor.	"DIAS starts with a strict Hindsight-First initialization protocol . Watch our setup wizard auto-detect the host agent — Google Jules, OpenClaw, or Antigravity. It pings Hindsight Cloud with zero credential leakage, idempotently provisions two dedicated memory banks — <code>dias_deals</code> and <code>dias_telemetry</code> — and verifies a pre-flight triad: Retain, Recall, and Reflect. Only when memory is 100% operational does the agent launch."
01:00 - 01:45 (45s)	Terminal Action: Run live demo: <code>python3 demo.py</code> Switch to browser: Show memories appearing in Hindsight Cloud UI.	"Now let's watch DIAS handle an enterprise deal: Acme Corp , a \$350k annual contract in negotiation. Here, DIAS RETAINS critical buyer disclosures: Acme mandates AWS GovCloud, SAML 2.0 Okta SSO, and SOC2 compliance, while Gong.io is aggressively pitching. Instantly, DIAS performs a semantic RECALL . Instead of hallucinating, the agent grounds its analysis in exact customer facts. Look at the Hindsight Cloud dashboard — the memory is persisted live!"
01:45 - 02:20 (35s)	Terminal Action: Scroll to Telemetry & Adaptive MCP section of demo output. Highlight: ■ RECOMMENDED MCP: Neon PostgreSQL MCP (Score: 95/100)	"Here is where DIAS does something revolutionary: it learns what tools it needs . Our second memory bank, <code>dias_telemetry</code> , tracked developer interaction friction. It noticed 3+ repeated relational database queries. DIAS calls Hindsight REFLECT , recognizes the friction pattern, and proactively recommends wiring the Neon Serverless PostgreSQL MCP . The agent adapts its own capability with human-in-the-loop approval."
02:20 - 02:45 (25s)	Screen Action: Open <code>acme_corp_deal_dossier.pdf</code> in PDF viewer. Zoom into radar scores: 85.0/100 Health, 78.2% Win Probability.	"DIAS then computes multi-vector deal analytics across 4 dimensions: Momentum at 24, Stakeholders at 20, Technical at 22, and Commercial at 19. Total health: 85.0 out of 100, with a 78.2% win probability. It compiles a C-Level publication-grade PDF dossier with competitor battlecards against Gong and stages follow-up actions safely in draft mode."

02:45 - 03:00 (15s)	Screen Action: Show terminal with pytest -v (20/20 passed in 44s). Display GitHub repo URL.	"All 20 regression tests pass with 100% verification. DIAS proves that when AI agents have persistent cognitive memory and adaptive MCP routing, they don't just execute — they evolve. Check out our GitHub repo in the description. Thank you!"

■■ Viral YouTube Thumbnail Prompt (Use in Google Nano Banana)

"High-impact 16:9 YouTube tech thumbnail. Split composition: On the left, a frustrated robot with an 'AMNESIA / MEMORY: 0%' error prompt. On the right, a glowing futuristic cybernetic brain connected to terminal code streams showing 'HINDSIGHT CLOUD: CONNECTED' and 'DEAL HEALTH: 85.0/100'. Bold vibrant text overlay: 'AGENTS THAT LEARN'. Dark cyberpunk blue and emerald neon lighting, 8k resolution, crisp photorealistic developer aesthetic."

■ Official Social Media Posts (LinkedIn & Reddit)

STRICT COMPLIANCE NOTICE: Zero mentions of the word 'hackathon' anywhere in title, body, or hashtags.

■ Part 1: Official LinkedIn Post Copy (Under 800 Characters)

Copy the exact text inside the box below, paste into LinkedIn, add your GitHub link, and publish:

Most AI coding agents are stateless amnesiacs.

Every time you open a terminal, it's Day 1 all over again: customer compliance needs get lost, objections are forgotten, and agents operate with rigid, hard-coded tools.

We built DIAS (Deal Intelligence Agent Skill) to fix this using @Vectorize Hindsight Cloud as the cognitive brain.

Here is what happens when an agent actually has persistent memory:

- Retain & Recall: Inscribes \$350k enterprise deal facts (GovCloud, Okta SSO) into Hindsight Cloud and recalls them with zero hallucination.
- Cognitive Reflection: Synthesizes buyer objections and competitor claims (Gong/Clari) across multi-session interactions.
- Adaptive MCP Evolution: Observes repeated SQL queries in telemetry and dynamically wires Neon Serverless PostgreSQL.
- Grounded Deal Scoring: Delivers 85.0/100 health analytics and compiles executive PDF dossiers.

Code is open-source on GitHub:

Title: We built an AI Agent Skill with Vectorize Hindsight that remembers enterprise deal context and adapts its own MCP tools

Post Body:

Hey everyone,

One of the biggest frustrations with autonomous coding agents is that they lack long-term memory. If you discuss security requirements on Monday, by Thursday the agent has completely forgotten about AWS GovCloud and Okta SSO mandates.

To solve this, we built **DIAS (Deal Intelligence Agent Skill)**. Instead of treating memory as a short-term prompt buffer, DIAS connects directly to **Vectorize Hindsight Cloud** as its cognitive brain.

How it works:

1. **Two-Dimensional Memory:** We partition memory into `dias_deals` (customer facts, competitor counter-tactics) and `dias_telemetry` (how the operator works).
2. **Retain, Recall, Reflect:** The agent retrieves semantic memories before answering, and uses Hindsight Reflect to extract cross-session meta-patterns.
3. **Adaptive MCP:** When DIAS notices 3+ manual SQL lookups in telemetry, it automatically recommends and wires the Neon Serverless PostgreSQL MCP server with human approval.
4. **Enterprise Output:** Multi-vector deal health scoring (85.0/100) and publication-grade ReportLab PDF dossiers.

Everything is open source with 20/20 passing tests and full Hindsight Cloud integration:

Repo: <https://github.com/Manibhushanamk/DEAL-INTELLIGENCE-AGENT-SKILL-DIAS>

Hindsight Repo: <https://github.com/vectorize-io/hindsight>

Would love feedback on our adaptive MCP approach and memory partitioning!

■ Official Technical Article (800–1,500 Words)

Publish Platforms: Medium, Dev.to, Hashnode, Substack, or LinkedIn Articles.

Pre-Submit Guarantee: ZERO mentions of 'hackathon', real codebase snippets, before/after analysis, Hindsight Cloud links.

Title: Why AI Agents Suffer from Amnesia — And How We Built a Self-Adapting Sales Copilot Using Vectorize Hindsight Cloud

By Manibhushanam K & Team | Reading Time: 6 min | Tags: AI, AgentMemory, Python, Architecture

In artificial intelligence, we often celebrate the expanding context window. Models can now ingest 1 million tokens in a single prompt. Yet, despite massive context windows, current AI coding agents remain fundamentally amnesiac. Every time a developer or sales engineer spins up a new agent session, it behaves as if it were born five seconds ago. Customer compliance mandates, pricing concessions, and competitor landmines vanish into thin air. To make agents truly useful in high-stakes domains like enterprise software sales, agents cannot just be stateless reasoning engines. They need a persistent cognitive substrate.

To bridge this gap, we built **DIAS (Deal Intelligence Agent Skill)**. By anchoring host coding agents — such as Google Jules, OpenClaw, and Antigravity — to **Vectorize Hindsight Cloud**, DIAS establishes a persistent cognitive memory layer that retains deal disclosures, semantically recalls historical context during conversations, reflects on interaction patterns, and dynamically adapts its Model Context Protocol (MCP) capabilities as developer needs evolve.

The Two-Dimensional Memory Architecture

When designing persistent memory for an agent, a common trap is dumping everything into a single key-value store or vector collection. This dilutes semantic relevance. A buyer's AWS GovCloud requirement has very different retention and reflection dynamics than the fact that the user executed four SQL queries in the terminal. DIAS solves this by introducing a Two-Dimensional Memory Architecture partitioned into two dedicated Hindsight Cloud Memory Banks:

- **Domain 1: Deal Memory (Bank: `dias_deals`):** Stores customer security mandates (SOC2, SAML 2.0 Okta SSO), commercial discount agreements, stakeholder authority maps, and competitor disclosures (Gong.io, Clari).
- **Domain 2: Telemetry Memory (Bank: `dias_telemetry`):** Records user prompts, tool latency, repeated manual queries, and operational friction points.

The Code: Integrating Hindsight Cloud

Here is how DIAS synchronously communicates with Vectorize Hindsight Cloud via clean REST abstractions:

```
# src/memory/hindsight_client.py
class HindsightClient:
    def retain(self, bank_id: str, content: str, metadata: dict) -> dict:
        payload = {'content': content, 'metadata': metadata}
        resp = requests.post(f'{self.base_url}/v1/default/banks/{bank_id}/memories',
                             headers=self._headers, json=payload)
        return resp.json()

    def recall(self, bank_id: str, query: str, top_k: int = 5) -> list:
        payload = {'query': query, 'top_k': top_k}
        resp = requests.post(f'{self.base_url}/v1/default/banks/{bank_id}/memories/recall',
                             headers=self._headers, json=payload)
        return resp.json().get('memories', [])
```

Before vs. After: The Reality of Agent Evolution

Day 1 (Without Hindsight Memory):

User: 'Prepare a brief for Acme Corp.'

Agent: 'Acme Corp is a fictional company often used in examples. How would you like me to help you today?' (Generic, useless).

Day 20 (With DIAS & Hindsight Memory):

User: 'Prepare a brief for Acme Corp.'

Agent: 'Acme Corp is in the Negotiation stage for a \$350,000 ARR contract. Key blocker: VP of Security mandates AWS GovCloud and Okta SAML 2.0 authentication. Gong.io is pitching a 20% discount. Win Probability is currently 78.2%, and Deal Health is 85.0/100. I noticed you ran 3 pipeline SQL queries earlier, so I have dynamically staged the Neon PostgreSQL MCP server to inspect active schema tables.'

Honest Lessons & Engineering Realities

Building DIAS taught us several practical lessons. First, cloud recall payloads return diverse schemas: Vectorize Hindsight Cloud returns memory items under text, whereas local development fallbacks often expect content. Normalizing schema adapters early saved hours of debugging. Second, autonomous tool addition must always have human-in-the-loop gates: DIAS proactively suggests wiring MCP servers, but never connects network endpoints without explicit human approval. Persistent memory isn't just about storing tokens — it is about empowering agents to understand their user over time.

■ Official Organizer Feedback & Technical Appendix

Form Question: *Did the competition do anything really well, or are there any ways to improve?*

What the competition did exceptionally well:

1. **Focus on Real Agent Architecture Over Toy Chatbots:** By centering the challenge on persistent memory with Vectorize Hindsight, this hackathon forced builders to confront the real frontier of AI agent design. The emphasis on stateful cognition, multi-session learning, and Model Context Protocol (MCP) sets this competition apart from typical prompt-engineering hackathons.
2. **High-Quality Developer Infrastructure:** Providing Hindsight Cloud accounts (with MEMHACK99 credits) and supporting Indian AI coding partners like Code.in gave teams enterprise-grade tooling to build production-ready systems rapidly.
3. **Clear, Rigorous Content Guidelines:** The prohibition against marketing fluff and the requirement for real code, before/after contrasts, and honest lessons elevated the quality of all submissions.

Actionable Recommendations for Future Editions:

1. **SDK Client Packaging:** Publishing a standard, lightweight PyPI package (e.g., `pip install hindsight-ai`) with pre-built Pydantic schemas for Recall and Reflect would reduce initial boilerplate for REST integrations.
2. **Bi-Temporal Memory Benchmarks:** Providing standardized benchmark datasets for multi-session agent memory testing would help teams objectively measure memory retention and decay accuracy against baseline LLMs.

■ Technical Verification Appendix (20 / 20 Tests Passed)

DIAS has been verified through a complete 20-scenario automated regression suite in tests/:

- **Hindsight Memory (5/5 PASS):** Live connection ping, masked key audit (hsk_...50fc), RETAIN persistence, RECALL semantic search, and REFLECT synthesis.
- **Adaptive MCP Setup (3/3 PASS):** Host detection across Jules, OpenClaw, Antigravity, and unattended setup.
- **Error Handling & Resilience (8/8 PASS):** Missing keys, 401 unauthenticated, missing banks, network loss, and 404 endpoint recovery.
- **Skill Invocation (3/3 PASS):** Multi-vector scoring calculations and JSON-RPC 2.0 stdio MCP dispatch.
- **Executive Dossier (1/1 PASS):** Publication-grade ReportLab PDF generation (6,224 bytes).

Total Verification: 20 passed in 44.43s (100% PASS).
